**CONTENT**

Hi Team,

We are officially kicking off the Customer Support Portal project.

Over the past few months we've seen a significant increase in customer support calls, especially for simple status updates and ticket requests. Management would like customers to be able to handle these tasks themselves through an online portal.

For the MVP, let's focus on the core functionality first.

The initial business requirements are:

- Customers should be able to register using their email address.
- Registered customers should be able to securely log in.
- Customers should be able to reset forgotten passwords via email.
- Customers should be able to create and track support tickets.
- Customers should receive email notifications whenever the status of a ticket changes.

We'll discuss the support team's workflow during this week's requirements meeting.

Please review these items before our meeting on Thursday.

Regards,

Sarah Johnson
Business Product Manager

Hi Sarah,

After yesterday's discussion with the support operations team, I collected a few additional requirements that weren't included in the kickoff email.

The support agents would like a dedicated dashboard where they can:

- View all assigned tickets.
- Update ticket status.
- Assign or reassign tickets to other agents.
- Add internal notes that remain hidden from customers.

Customers also requested a few usability improvements:

- Upload screenshots or PDF documents when submitting a ticket.
- Search for previously submitted tickets using the ticket number.

- Update ticket information while the ticket is still in the "Open" state.

From a technical perspective, I think we should also target support for approximately 5,000 concurrent users and keep average API response times below 500 milliseconds.

I've intentionally left reporting requirements out for now because I think we should confirm those with management before committing them to the BRD.

Regards,

Rahul Mehta
Technical Lead

Hi Sarah and Rahul,

I've completed the initial security review for the proposed Customer Support Portal.

Most of the functional requirements look good, but I'd like the following security requirements to be included before development begins.

- Customer passwords must never be stored in plain text and should be securely hashed.
- All customer information should be encrypted while stored in the database.
- Support agents and administrators should authenticate using multi-factor authentication.
- Customer accounts can continue using email and password for the first release.
- User sessions should automatically expire after 15 minutes of inactivity.
- Only support agents and administrators should be able to access internal ticket notes.
- All important user actions should be recorded in audit logs for compliance purposes.

I also recommend scheduling automated daily database backups and defining a system availability target before finalizing the BRD.

These requirements should help us satisfy our internal security and compliance standards without significantly impacting the delivery timeline.

Regards,

Anita Sharma
Security Architect

Customer Support Portal - Working Notes
Author: Sarah Johnson
Date: 15 Jul 2026

Need to confirm with support ops before freezing requirements.

Main reason for this project:
- too many customers calling just to check ticket status
- management wants more self-service
- reduce support workload if possible

Things everyone agreed on:
- customer accounts (email/password)
- forgot password via email
- online ticket submission
- customer can check ticket status themselves
- email updates whenever ticket status changes

Discussion points:
- should customers edit tickets after submission?
  -> maybe only while ticket is still Open
  -> once agent starts work, editing should probably be disabled

Support team requests:
- dashboard showing assigned tickets
- ability to transfer tickets between agents
- internal notes (customers should never see these)
- searching by ticket number is important
- filters for priority/status would be useful

Need to ask management:
- do they actually need reports for MVP?
- if yes, probably:
  * open tickets
  * avg resolution time
  * tickets by priority

Security meeting notes:
- hash passwords
- encrypt customer info
- MFA only for staff accounts
- customer MFA can wait
- 15 min session timeout sounds reasonable

Performance:
Rahul mentioned around 5k concurrent users.
Need confirmation from infrastructure team.
API target discussed was under 500ms.

Not doing in first release:
- chatbot
- live chat
- social login
- SMS notifications

Questions:
- reopen closed tickets?
- max attachment size?
- who owns archived tickets?
- should managers export reports?

Remember:
Ask CRM team about customer data sync.
Need UI mockups before next stakeholder meeting.

**CONTENT**

Speaker A: Good morning everyone. Thanks for making time today. The goal is to review the initial requirements for the Customer Support Portal before we start preparing the BRD.

Speaker B: Morning. I've spoken with the support team over the last few days. Their biggest complaint is the number of phone calls they receive just for ticket status updates.

Speaker C: Right, customers call even when nothing has changed.

Speaker D: Exactly. That's why management wants customers to track their own requests online instead of calling.

Speaker A: So that's still our primary business objective? Reduce support workload while improving customer experience?

Speaker B: Yes, that's what leadership wants.

Speaker C: Makes sense.

Speaker A: Okay. Let's start with authentication.

Speaker D: I think customers should register using email and password. Nothing too complicated for the first release.

Speaker B: Agreed.

Speaker C: Password reset through email?

Speaker D: Yes.

Speaker A: Social login?

Speaker B: I don't think that's worth doing for the MVP.

Speaker C: Yeah, we can always add Google or Microsoft login later.

Speaker A: Okay, I'll mark social login as a future enhancement.

Speaker D: Once customers log in, they should be able to create support tickets.

Speaker B: They also need to see every ticket they've submitted previously.

Speaker C: Along with the current status.

Speaker D: And timestamps.

Speaker A: Should customers edit tickets after submitting them?

Speaker B: Maybe while they're still open.

Speaker C: Yeah, if an agent has already started working on it, changing information could create confusion.

Speaker D: So editing only before the ticket moves to In Progress?

Speaker A: I like that.

Speaker B: Customers should also upload screenshots.

Speaker C: PDFs too.

Speaker D: Definitely. Support always asks for screenshots.

Speaker A: Alright.

Speaker B: From the support team's perspective, they need their own dashboard.

Speaker C: Assigned tickets.

Speaker D: Ticket reassignment.

Speaker B: Status updates.

Speaker C: Internal notes.

Speaker A: Internal notes should never appear to customers.

Speaker D: Absolutely.

Speaker B: Search is another big request.

Speaker A: Search by what?

Speaker B: Ticket number mainly.

Speaker C: Customer email.

Speaker D: Priority.

Speaker B: Assigned agent would also help supervisors.

Speaker A: Got it.

Speaker C: Management also mentioned reporting.

Speaker D: Basic reporting only.

Speaker A: Such as?

Speaker D: Number of open tickets.

Speaker B: Average resolution time.

Speaker C: Tickets by priority.

Speaker A: That's enough for MVP.

Speaker B: Security?

Speaker D: Password hashing is mandatory.

Speaker C: Encrypt customer information.

Speaker D: MFA for administrators and support agents.

Speaker B: Customers don't need MFA initially.

Speaker A: Session timeout?

Speaker C: Fifteen minutes.

Speaker D: Sounds reasonable.

Speaker B: Should we capture audit logs?

Speaker C: Yes, especially for status changes and administrative actions.

Speaker A: Rahul mentioned performance targets.

Speaker B: We estimated around five thousand concurrent users.

Speaker D: Average response time should stay below five hundred milliseconds.

Speaker C: Infrastructure team thinks that's achievable.

Speaker A: Availability target?

Speaker D: Ninety-nine point nine percent.

Speaker B: Daily database backups too.

Speaker C: Anything we're definitely leaving out?

Speaker D: Live chat.

Speaker B: AI chatbot.

Speaker C: SMS notifications.

Speaker A: Mobile app?

Speaker D: Phase two.

Speaker A: Okay.

Speaker B: One question though. Should customers be allowed to reopen closed tickets?

Speaker C: Support wasn't sure.

Speaker D: Let's leave that as an open question until we talk with operations.

Speaker A: Fine. I'll add it to the action items.

Speaker B: I think we've covered everything.

Speaker C: Sounds good.

Speaker D: Yep.

Speaker A: Thanks everyone. I'll update the requirements document before the next stakeholder review.
